# Our Research Topic

Detection of Energy Consumption and  
Performance of Third-party Applications using  
Machine Learning

# Introduction to the Overall Project

Our team has created a Non-Specific Technology Risk Calculator which will detect performance issues and energy consumption of a third-party application/developing language before the installation/development stage.

# Research Problem

- Any PC does not function well once an unknown third-party software is installed.
- Once the third-party program is installed, the PC becomes slow in performance and tasks.
- There can be risks to security and privacy issues coming from third-party applications.
- Lack of performance of device machines due to disk space or limited RAM capacity.

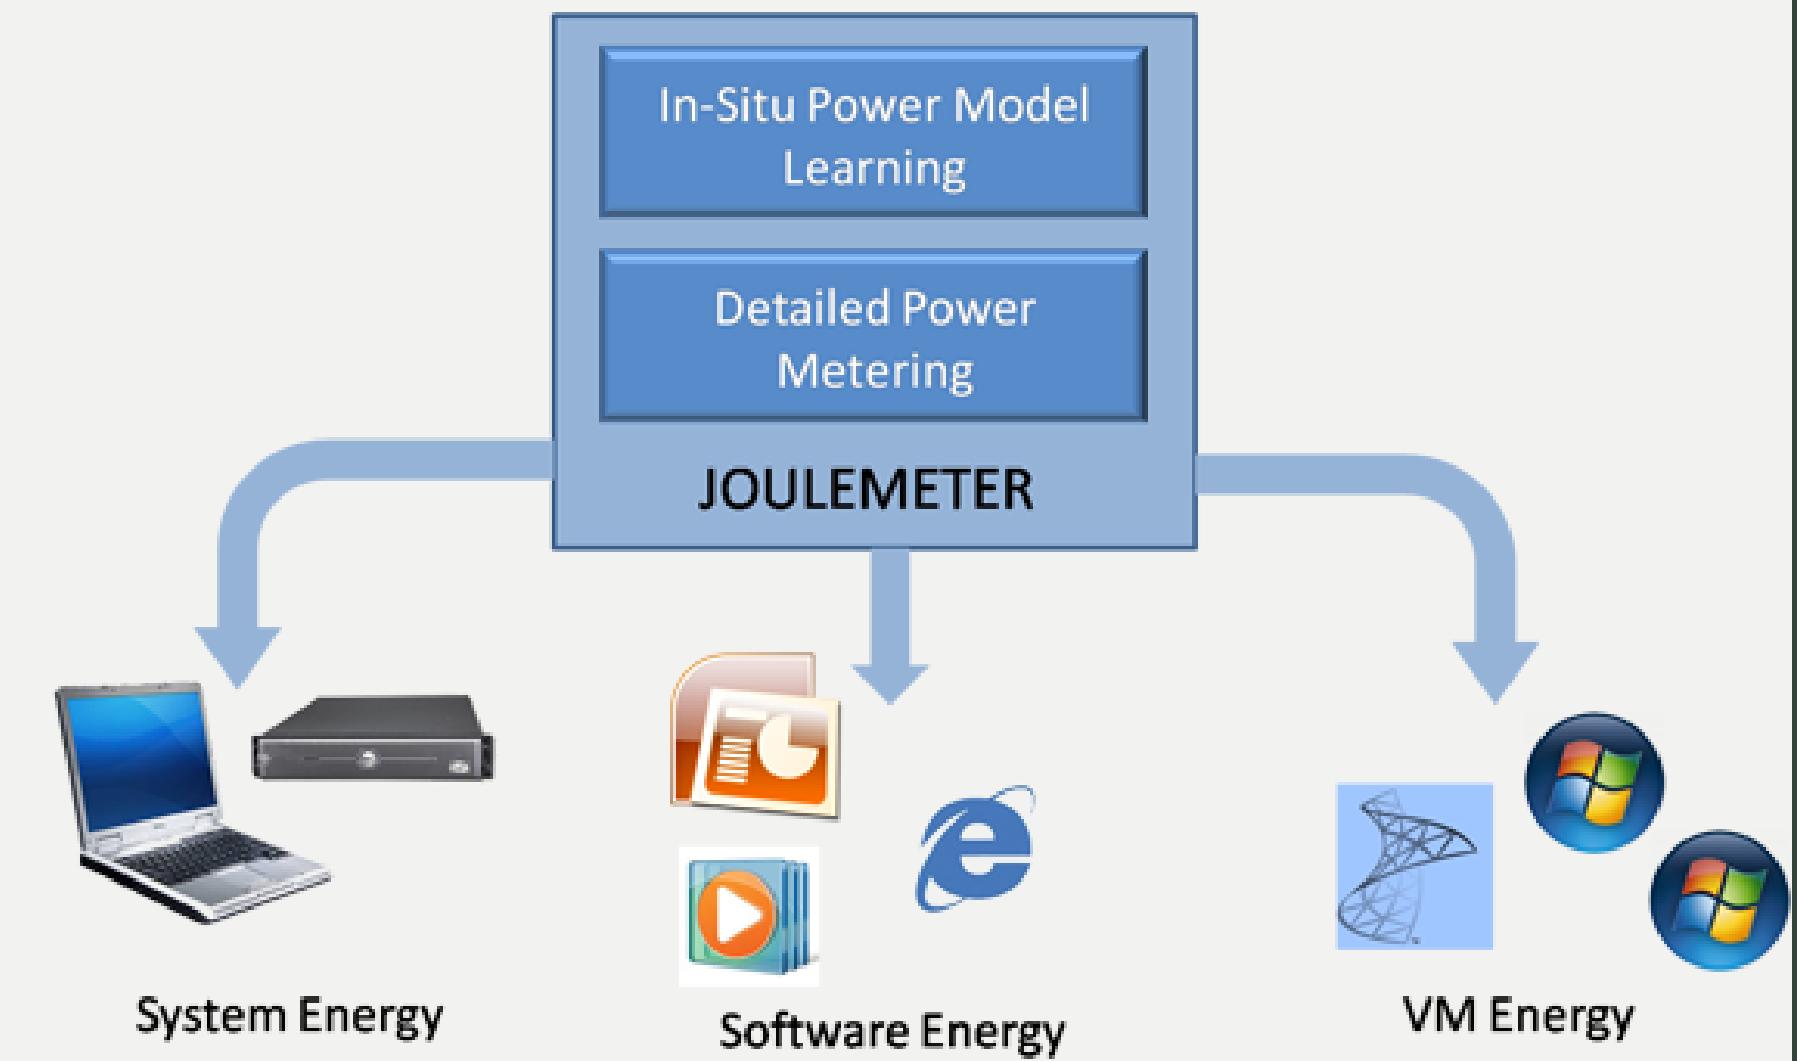

# Literary Review

A number of performance or energy apps are available on the market,  
but are they really convenient to use?

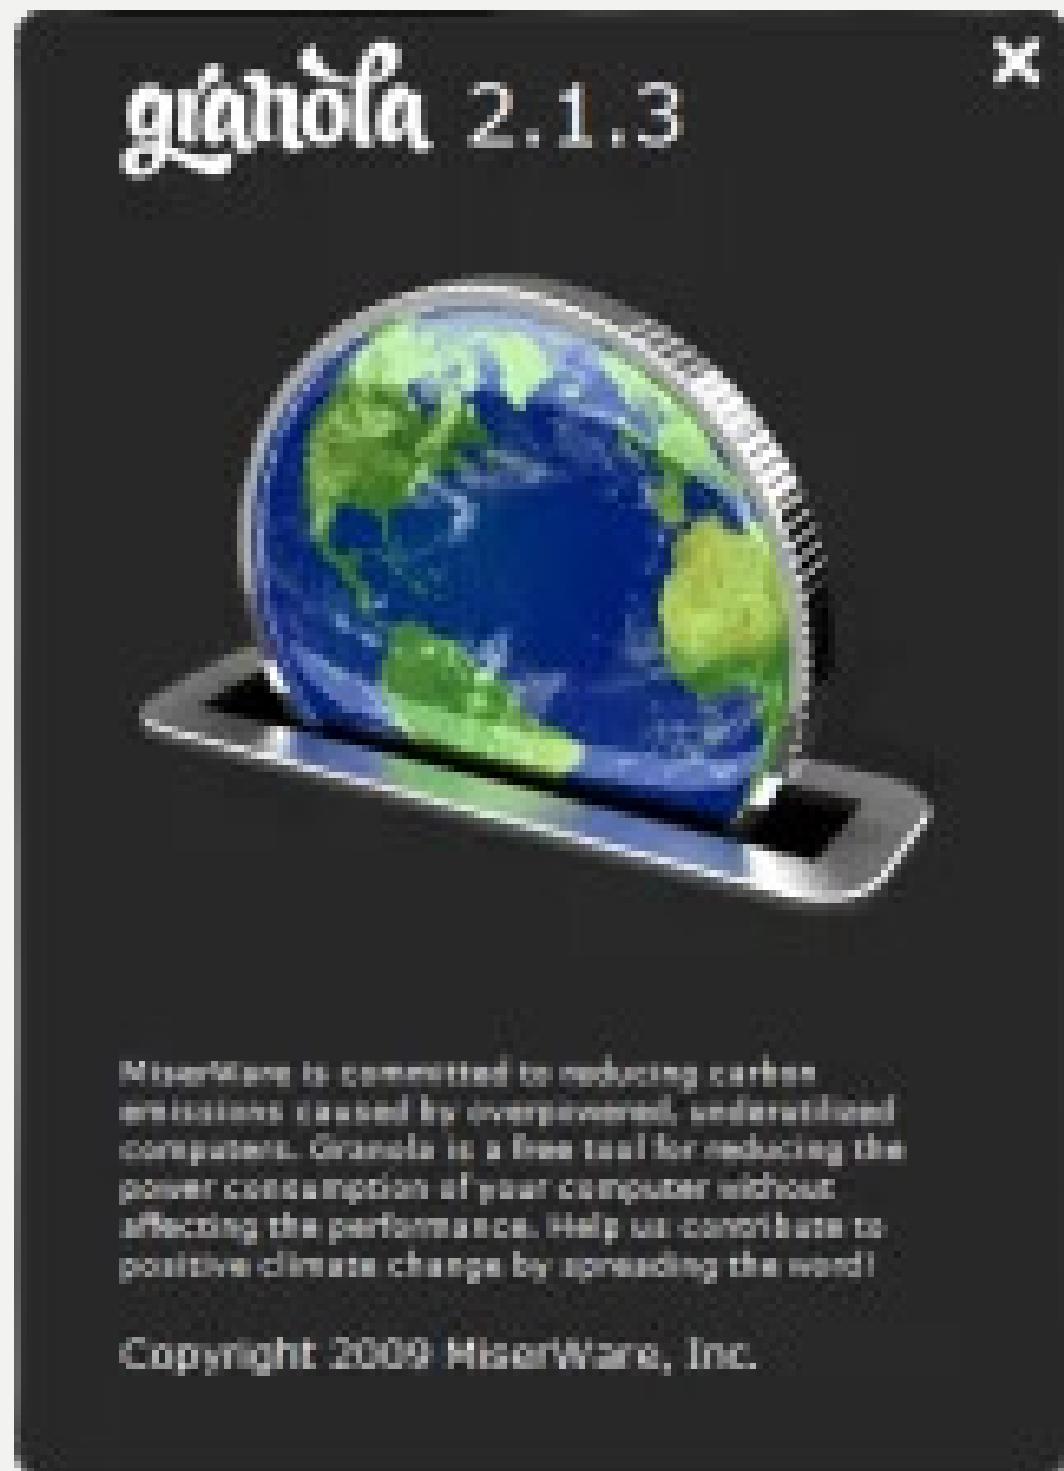

# JouleMeter

JouleMeter is a Windows application that uses machine learning algorithms to estimate the energy consumption of desktop PCs. It provides real-time energy consumption data, as well as historical data and energy-saving tips.

Problem? Deprecated due to performance issues.

# Granola

Granola is a lightweight Windows application whose purpose is to help users improve the energy efficiency of their computer and laptop.

Problem? Currently available but not updated for 6 to 10 years. There is also a problem with the installation folder.

# PowerTOP

PowerTOP is a Linux tool to diagnose issues with power consumption and power management.

Problem? Bad UI and user experience.  
Setup and Installation is a tedious task.

## Powertop

[Page](#) [Discussion](#)

[Read](#) [View source](#) [View history](#)

Category: Power management

**Powertop** is a tool provided by Intel to enable various powersaving modes in userspace, kernel and hardware. It is possible to monitor processes and show which of them are utilizing the CPU and wake it from its Idle-States, allowing to identify applications with particular high power demands.

# Intel Power Gadget

Intel® Power Gadget is a software-based power usage monitoring tool and includes an application, driver, and libraries to monitor and estimate real-time processor package power information

Problem? Bad UI and user experience. Setup and Installation is a tedious task.

# Task Manager

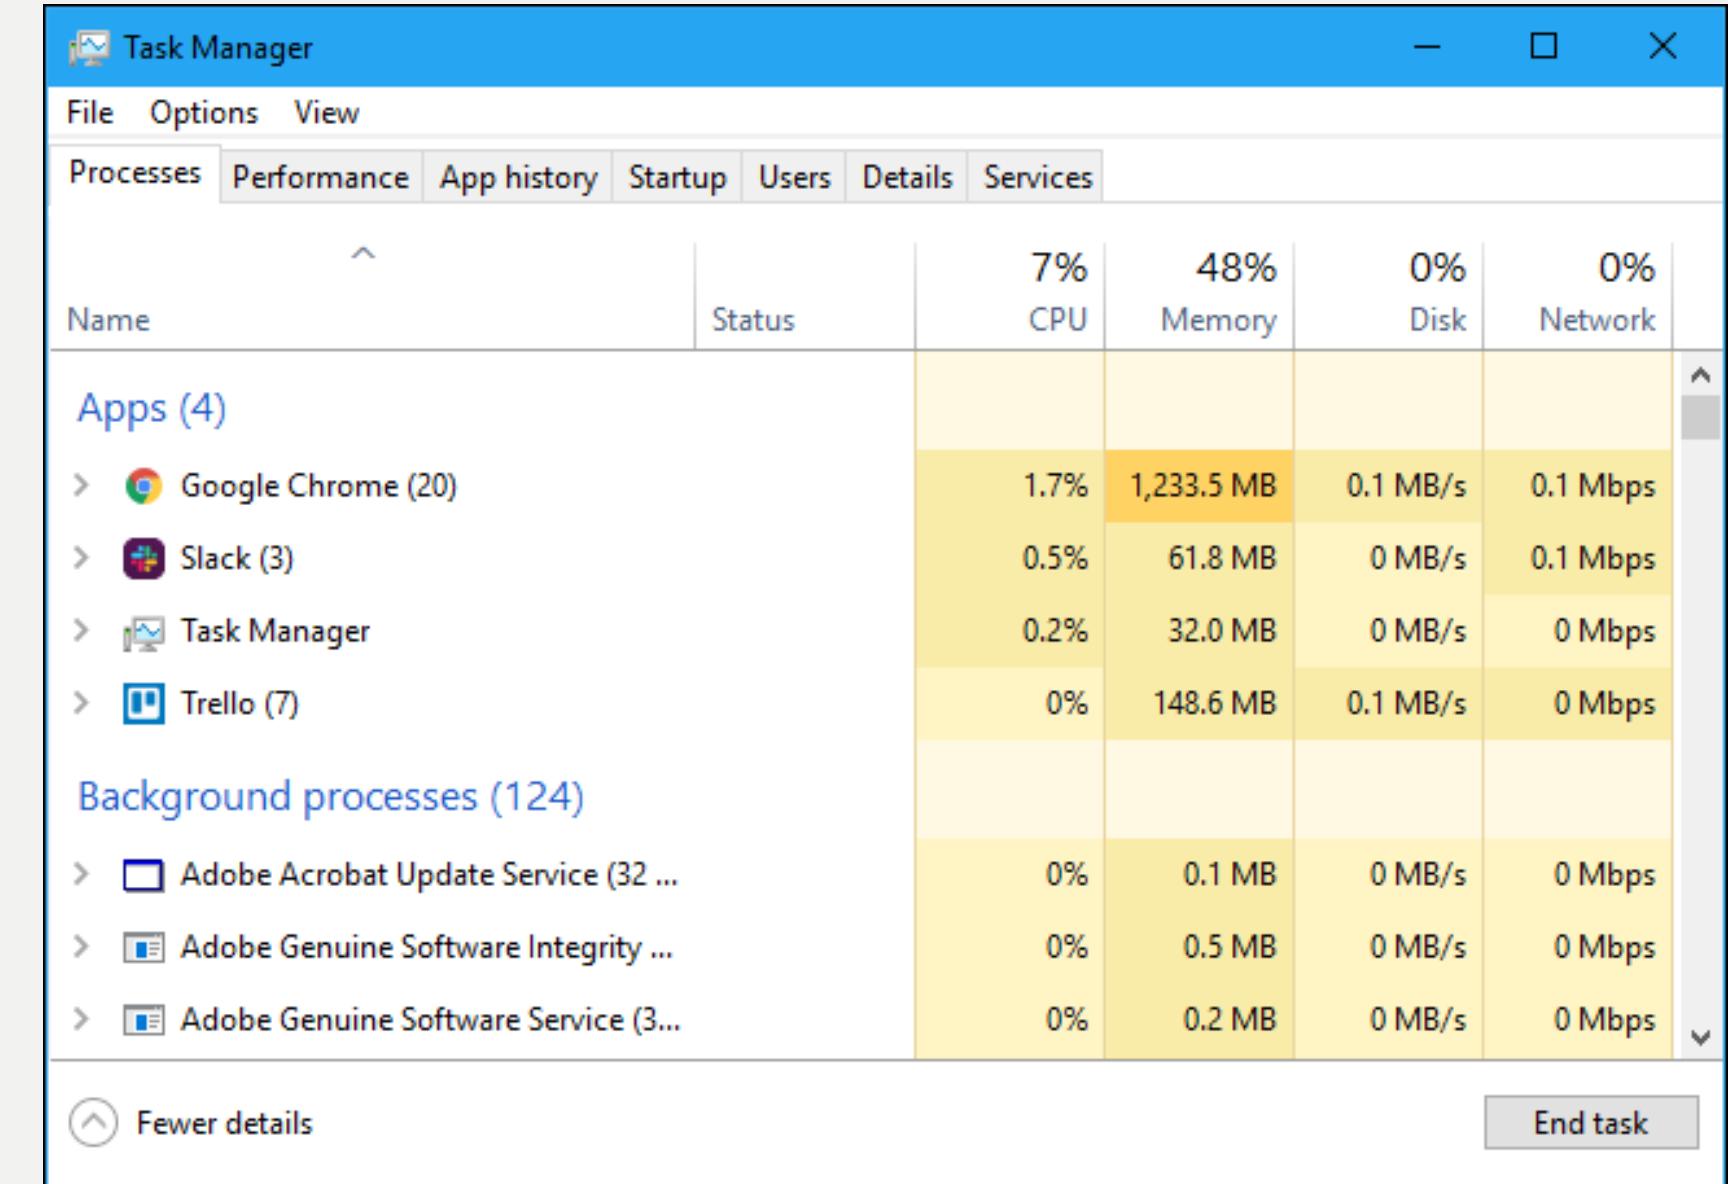

Task Manager provides real-time information about CPU, memory, disk, and network usage, which can be useful for monitoring performance and identifying potential performance bottlenecks.

Problem?

No personalized recommendations.

No comprehensive or accurate picture of energy usage.

Does not provide historical data or trends that can be used for analysis or planning.

The screenshot shows the Windows Task Manager window with the 'Processes' tab selected. The table displays the following data:

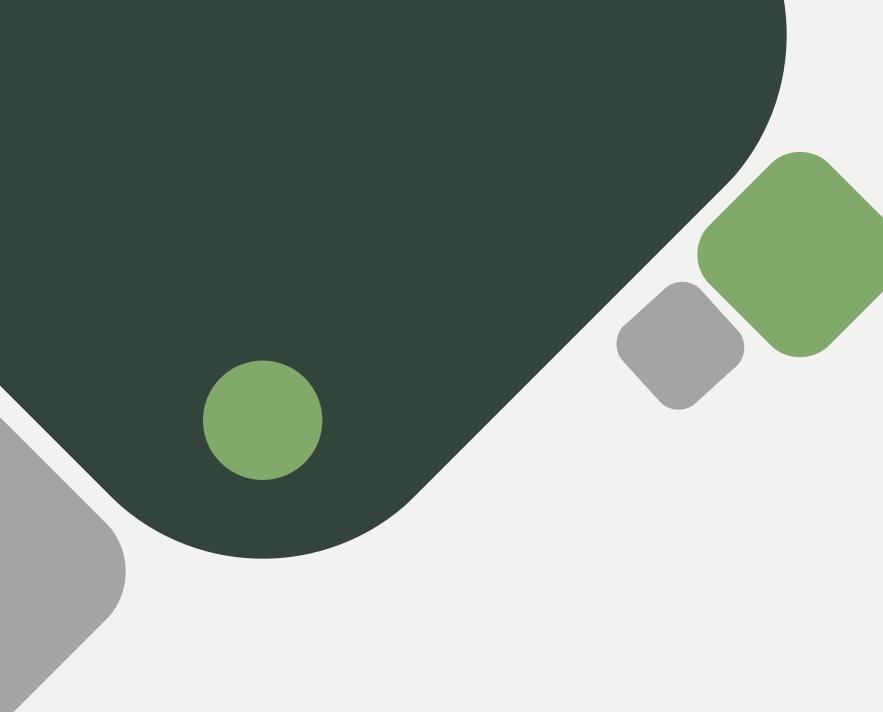

Name	Status	CPU	Memory	Disk	Network
Apps (4)					
> Google Chrome (20)		1.7%	1,233.5 MB	0.1 MB/s	0.1 Mbps
> Slack (3)		0.5%	61.8 MB	0 MB/s	0.1 Mbps
> Task Manager		0.2%	32.0 MB	0 MB/s	0 Mbps
> Trello (7)		0%	148.6 MB	0.1 MB/s	0 Mbps
Background processes (124)					
> Adobe Acrobat Update Service (32 ...)		0%	0.1 MB	0 MB/s	0 Mbps

**IT19048338 – JAYASINGHE H.M.C.P**

**IT19156316 – RAJAPAKSHA R.M.**

# Our Main Objective

To implement a Non-Specific Technology Risk Calculator which will detect performance issues and energy consumption of a third-party application/developing language before the installation/development stage.

# Our Sub- Objectives

**DETECTION OF USER DEVICE  
SPECIFICATIONS**

**COMPARISON OF  
SPECIFICATIONS WITH  
THIRD-PARTY APPLICATION**

**INITIATION OF THE  
PERFORMANCE FRAMEWORK  
FOR DEVELOPERS**

**GENERATION OF  
PERFORMANCE REPORT  
WITH SUGGESTIONS**

# Standards/Best Practices Used

- **Security:** Implement security measures such as encryption of sensitive data, authentication and authorization mechanisms.
- **Scalability:** Application can handle an increasing number of users and requests by using load balancing techniques and horizontal scaling.
- **Performance:** Optimized code and database queries to ensure that your application performs efficiently.
- **User Experience:** Focused on delivering a smooth and intuitive user experience by designing a clean and visually appealing interface.

# Commercialization- Packages

Free

Standard

- Mobile/Web Application functionalities.
- CPU and RAM Performance Check.
- App Suggestion Check.
- Security Analysis of Third-Party Application

LKR 490

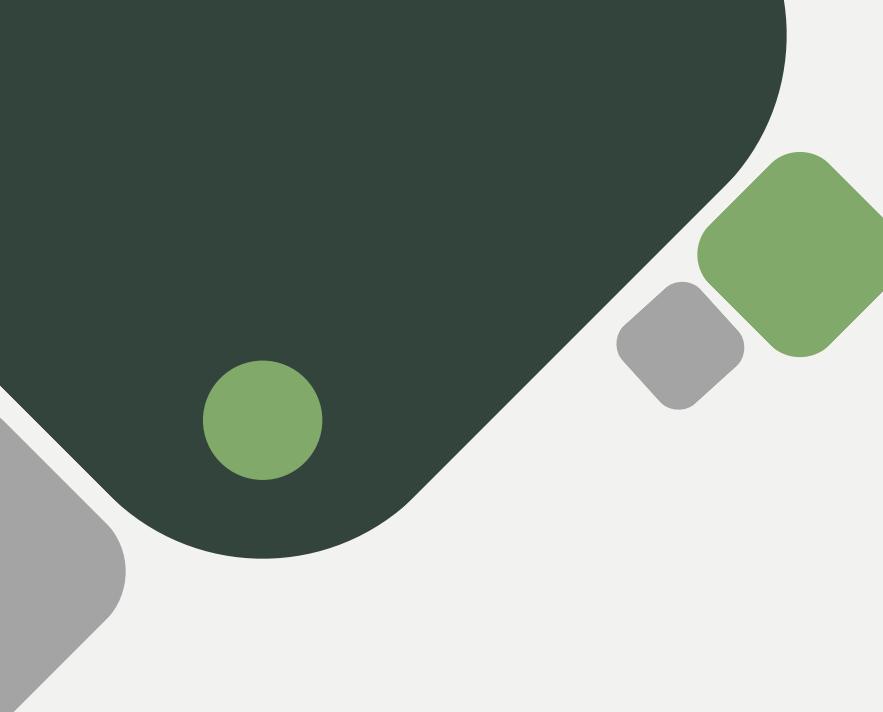

Platinum

- All features in standard package.
- CPU and RAM Alert System.
- App suggestion and Performance Monitoring.
- In-Depth suggestions for PC/Browser Check

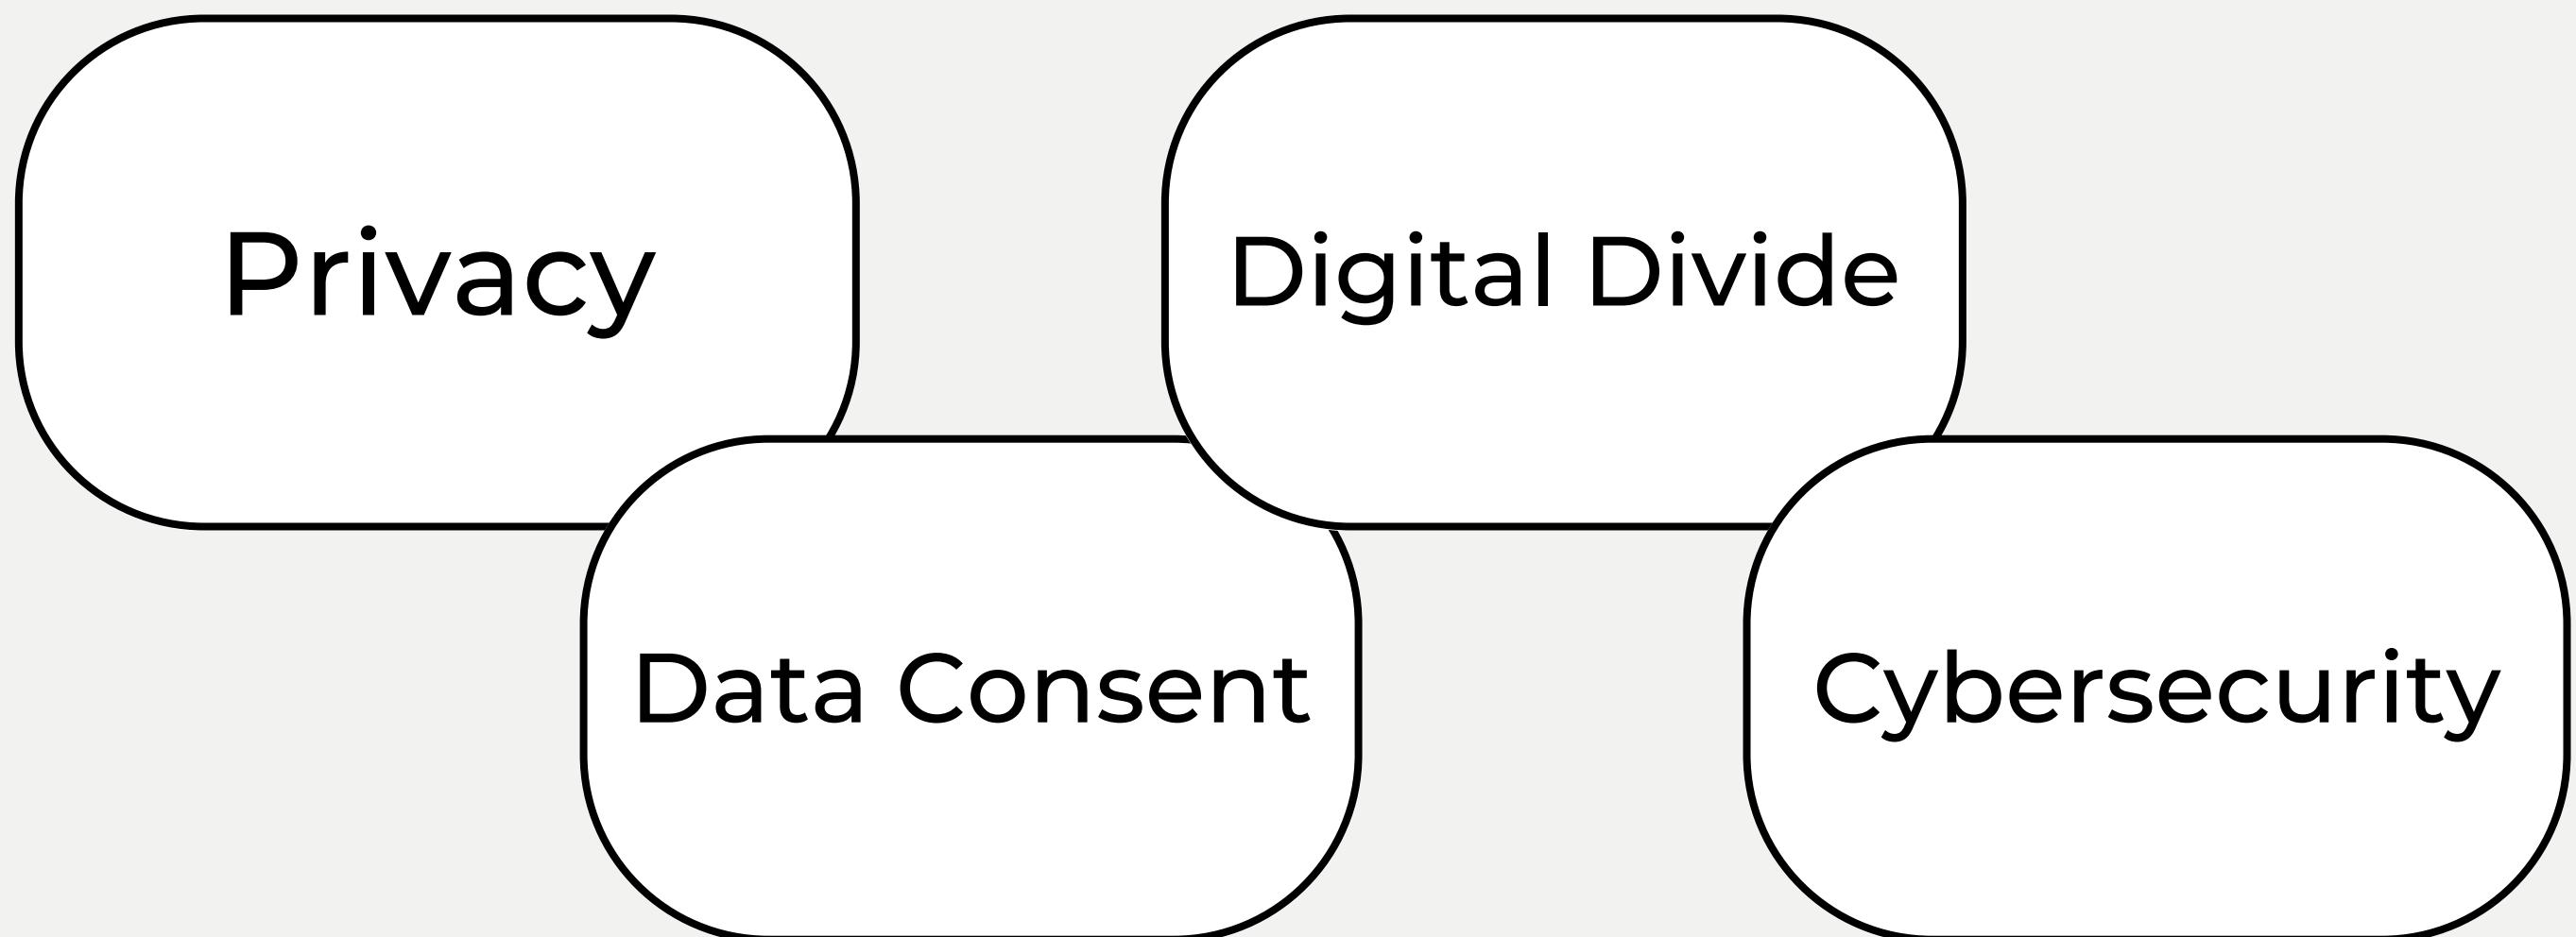

LKR 990

Developer

- Developer starter pack for code quality and syntax issues.
- VS Code Extension compatible with all OS.
- Simple bug tracking, maintenance index and language compatibility.

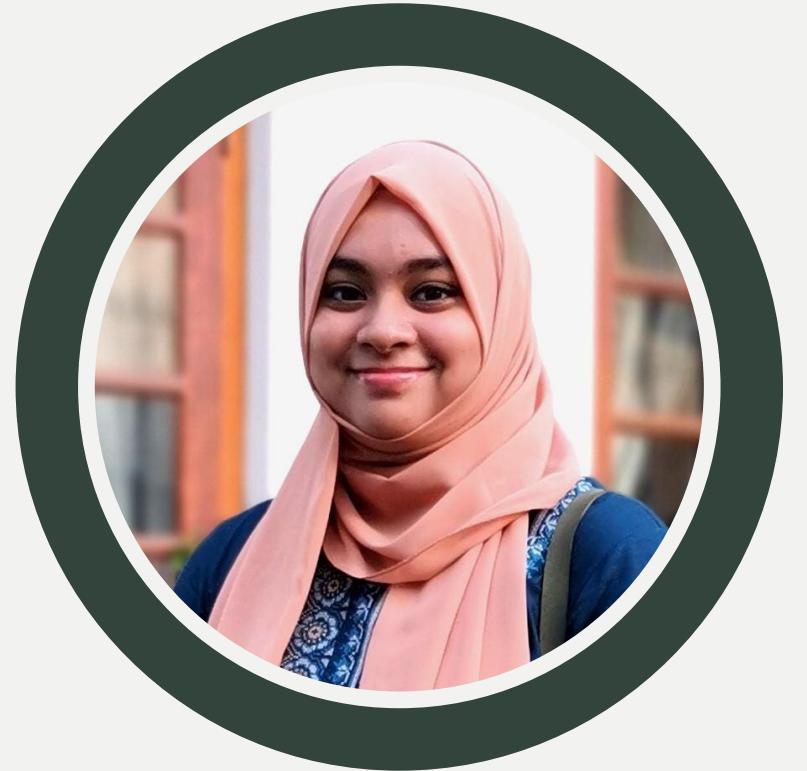

# **Professional, legal, social, security and ethical issues**

**IT19189086 – Rahman S.H**

**Software Engineering**

# Research Problem

- Installing third-party software can slow down a PC and pose security and privacy risks.
- It may also cause stress due to reduced performance caused by disk space or limited RAM.
- There can be risks to security and privacy issues to malware and virus attacks coming from the third-party application.

# Research Objectives

## Main Objectives

Detection of the User Device and  
Third-Party Application Performance  
and Compatibility

## Sub-Objectives

Allow the proposed system to run in the background before installation.

Carry out the detection of RAM and CPU usage and check for performance

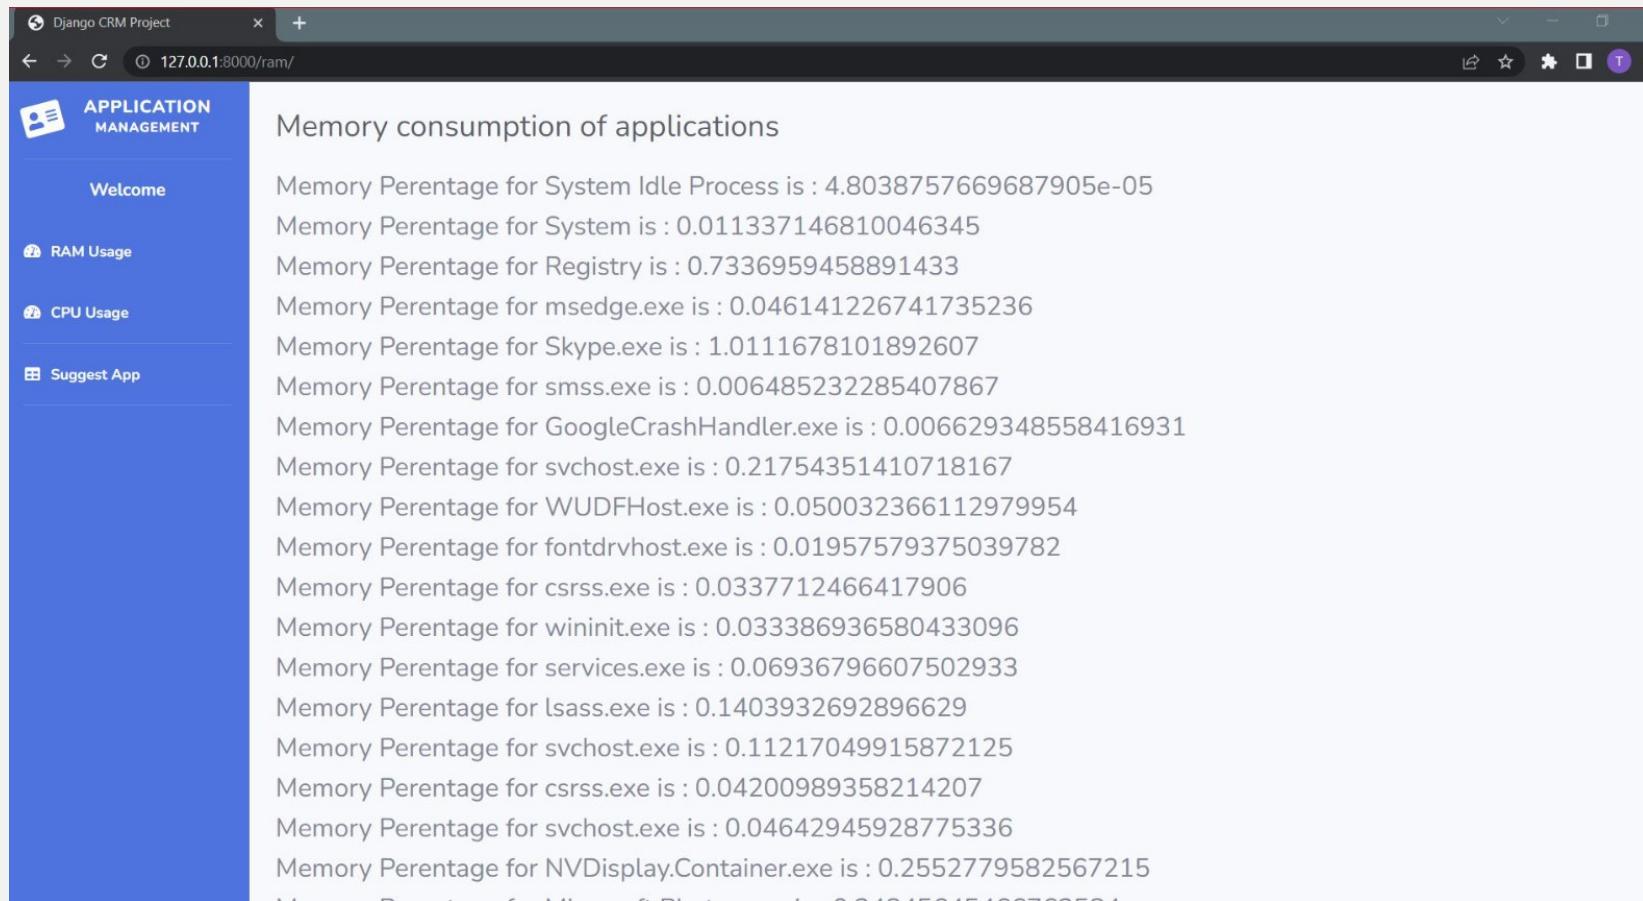

Display possible risks and performance errors on a security level basis with battery consumption

# Current Progress

- Detect and initiate the performance and compatibility test for CPU and RAM usage in mobile and web application. 
- Do a demonstration of the CPU and RAM usage with multiple background applications in mobile and web application. 
- Perform a performance check on battery usage and display of the highest consumption of apps according to levels in the mobile application.

# Research Problem

- How to identify the most suitable third-party application which matches user device performance and energy consumption ?
- How to identify what is the best suitable third-party application by providing the user requirement directly?

# Research Objectives

NSTRC

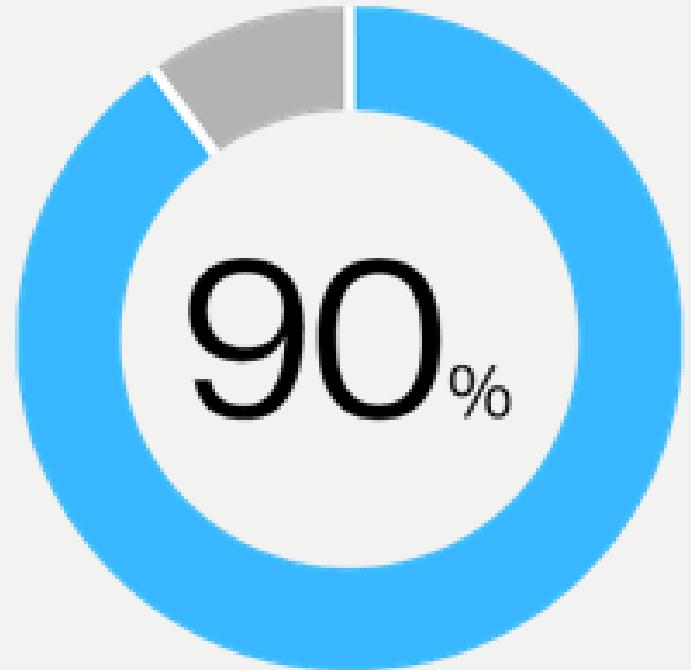

## Main Objective

- Comparison of User device performance compatibility with the third-party application and suggest the most suitable third-party application.

## Sub Objectives

- Identify the most suitable third-party application that matches the user's device.
- Identify different kinds of user requirements types.
- Suggest third-party applications according to priorities order.

# Current Progress

- ✓ Collected a similar kind third party application of software dataset.
- ✓ Collected different types of user requirements datasets.
- ✓ Trained the datasets with the content base recommendation ML algorithm and NLP.
- ✓ Completed the suggestion of the most suitable third-party application according to the performance of the user's device.
- ✓ Completed the suggestion of the most suitable third-party application according to the performance of the user's device based on user requirements.

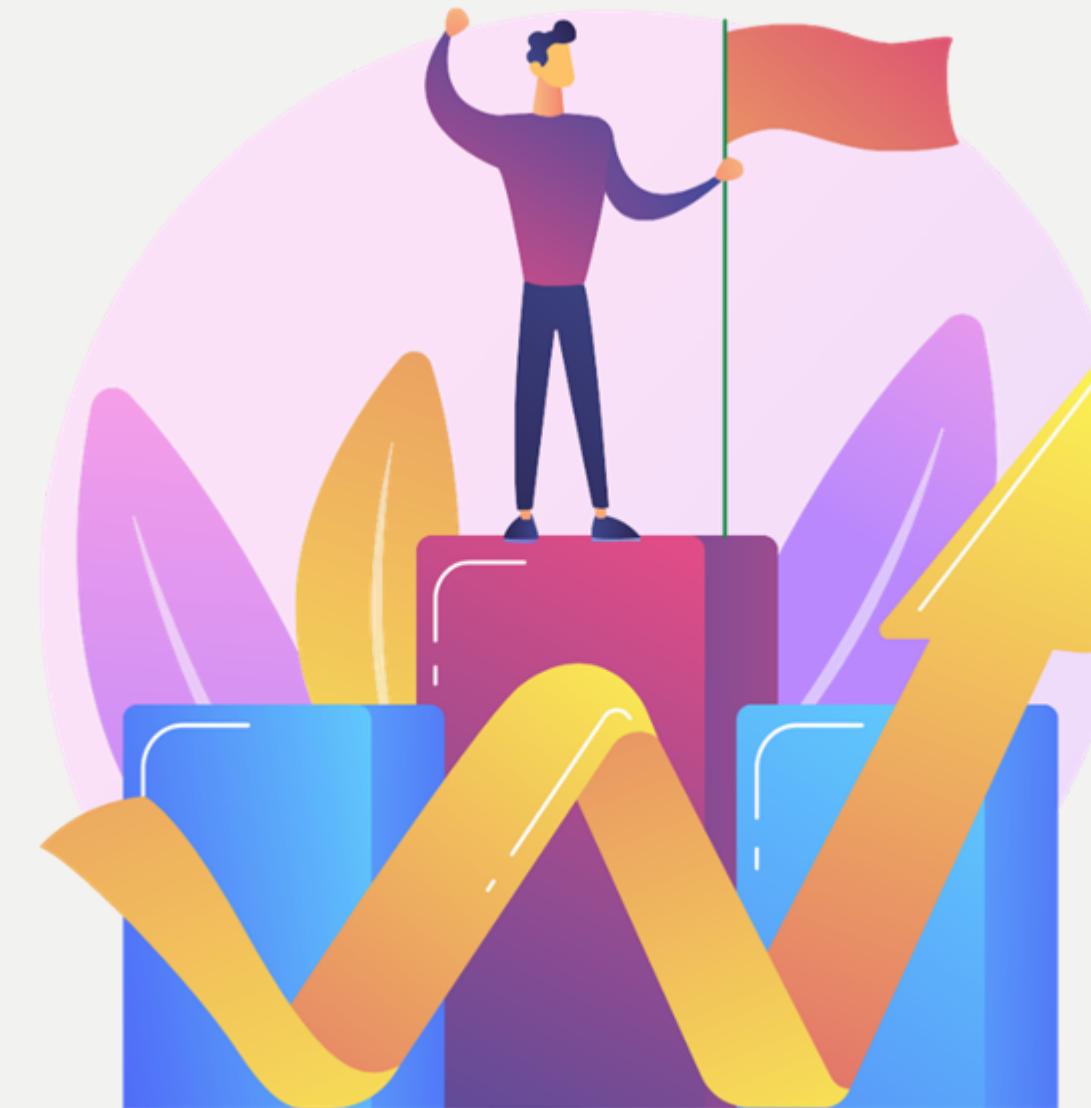

# Objectives completion

NSTRC

Dataset Preparing

Completed the suggestion of the most suitable third-party application according to the performance of the user's device and user requirements.

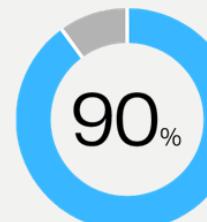

Trained the datasets with the content base recommendation ML algorithm NLP.

Completed the suggestion of the most suitable third-party application according to the performance of the user's device.

Completed the frontend for the web and mobile applications.

# Project Evidence and Best Practices

NSTRC

# Technical Terms

## In dataset training part

- Scikit-learn(sklearn) and keras used to create the model
- Used machine learning algorithm - Content-based recommendation - Django framework with django REST API
- Cosine similarity
- Natural Language Processing for identifying different kinds of user requirements - Keras framework with sequential API

## In web and mobile application development part

- Django python-based framework is used jinger template for the web application front end development.
- Flutter framework used for mobile application frontend development.
- Django REST framework to create the web API for the web and mobile applications.

# Requirements

## Functional requirements

- Identified the user device performance level.
- Identify the third-party application performance level.
- Identify different kinds of user requirements.
- Suggest the most suitable third-party application according to the performance level and different kinds of user requirements.

## User requirements

- Compatible with any smart device
- The processing speed should be high
- Data should be Reliable
- User Friendliness

# Research Problem

- Can every developer write quality code ?
- Is every working codes written with quality standards and better quality to manage the traffic?
- Does code quality and code maintainability affects the site performance?
- Does every developer know about the how to improve the site speed and how it be done?

# Research Objectives

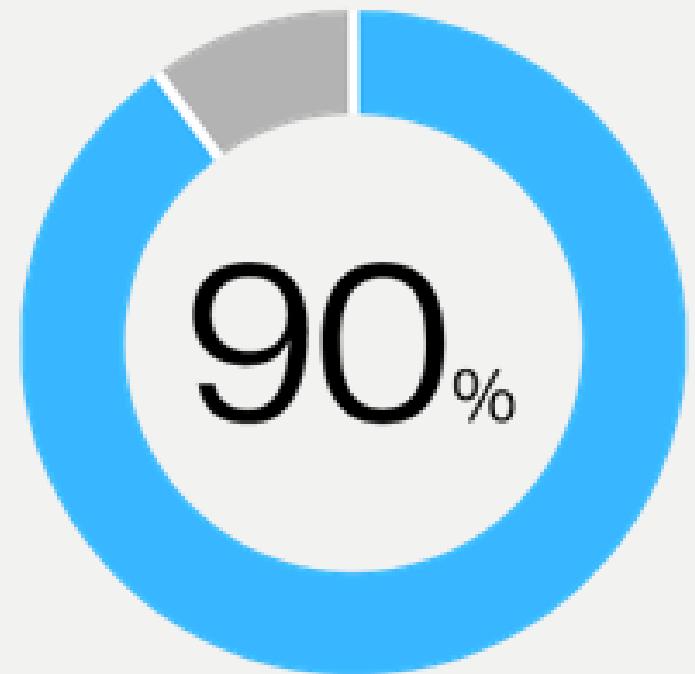

## Main Objective

- Detection of the Developer's code performance level, code quality level and speed level. Provide suggestions to improve the speed level and performance.

## Sub Objectives

- Collect data set and find a better solution architecture.
- Develop a package to identify maintenance index, code smells and performance score.
- develop a algorithm to identify java project code metrics.
- Develop a application with wrap all the developed components and generate reports and visualization. (backend and frontend apps)
- intigrate search engine for search performance improvements and code quality related things.

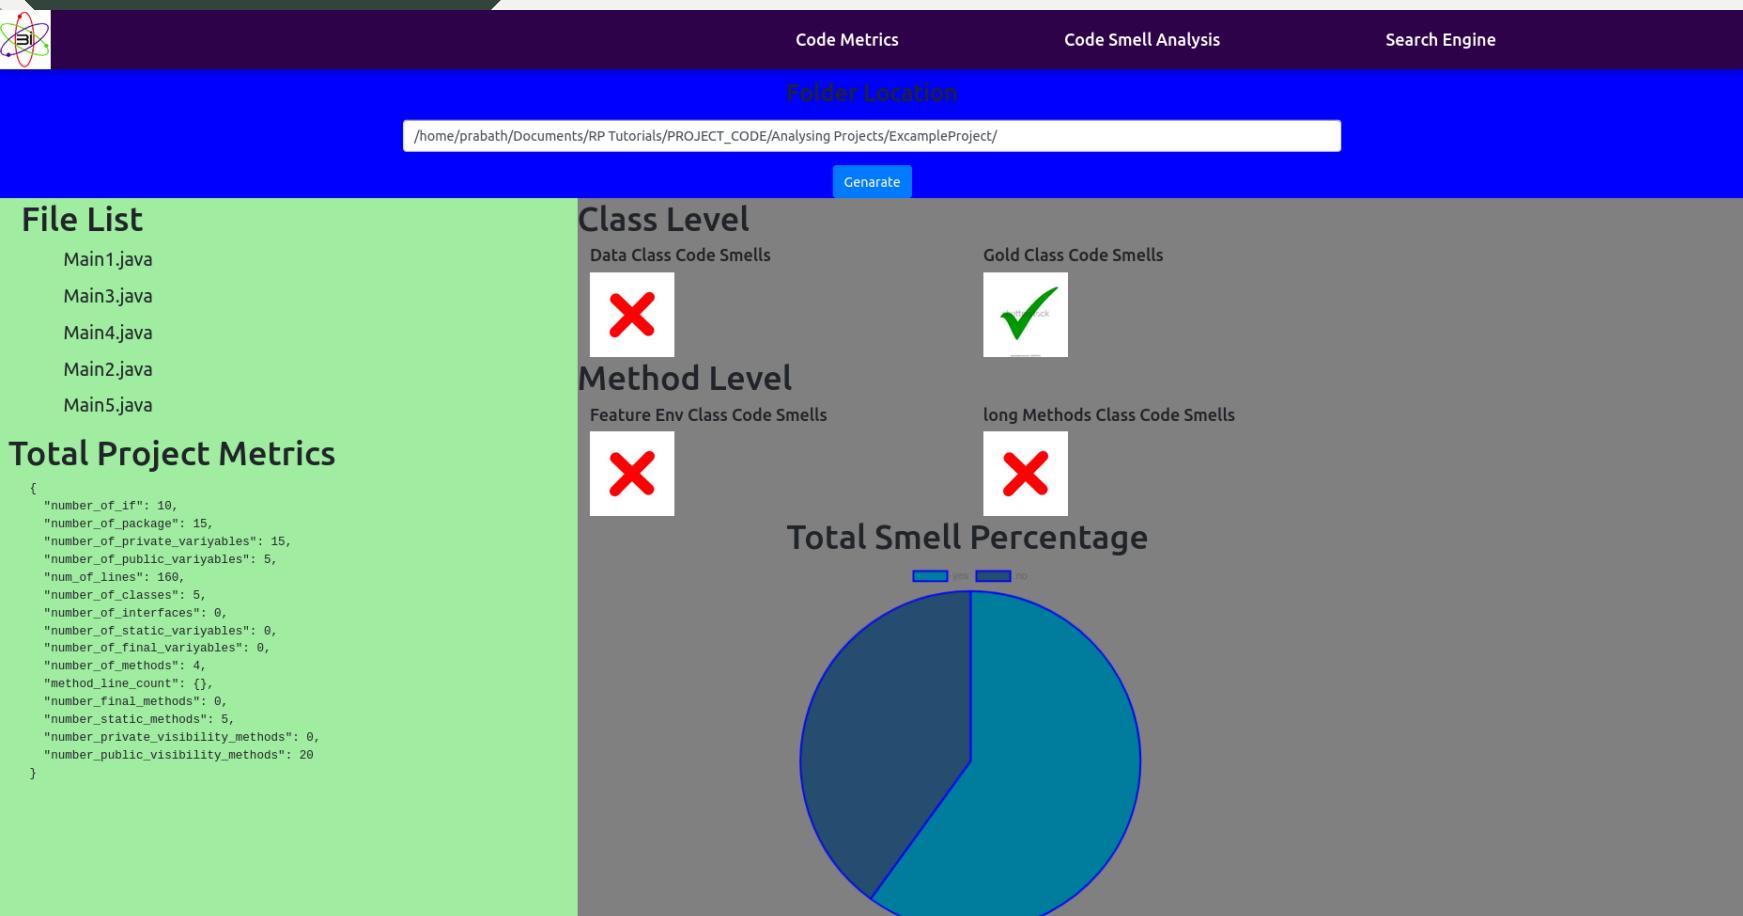

# Current Progress

- Collect data set and find a better solution architecture. ✓
- Develop a package to identify maintenance index, code smells and code analysis metrics performance score ✓
- Develop an algorithm to get java code metrics ✓
- Develop an application and wrap all the developed components and generate reports and visualization. ✓
- Integrate Search Engine

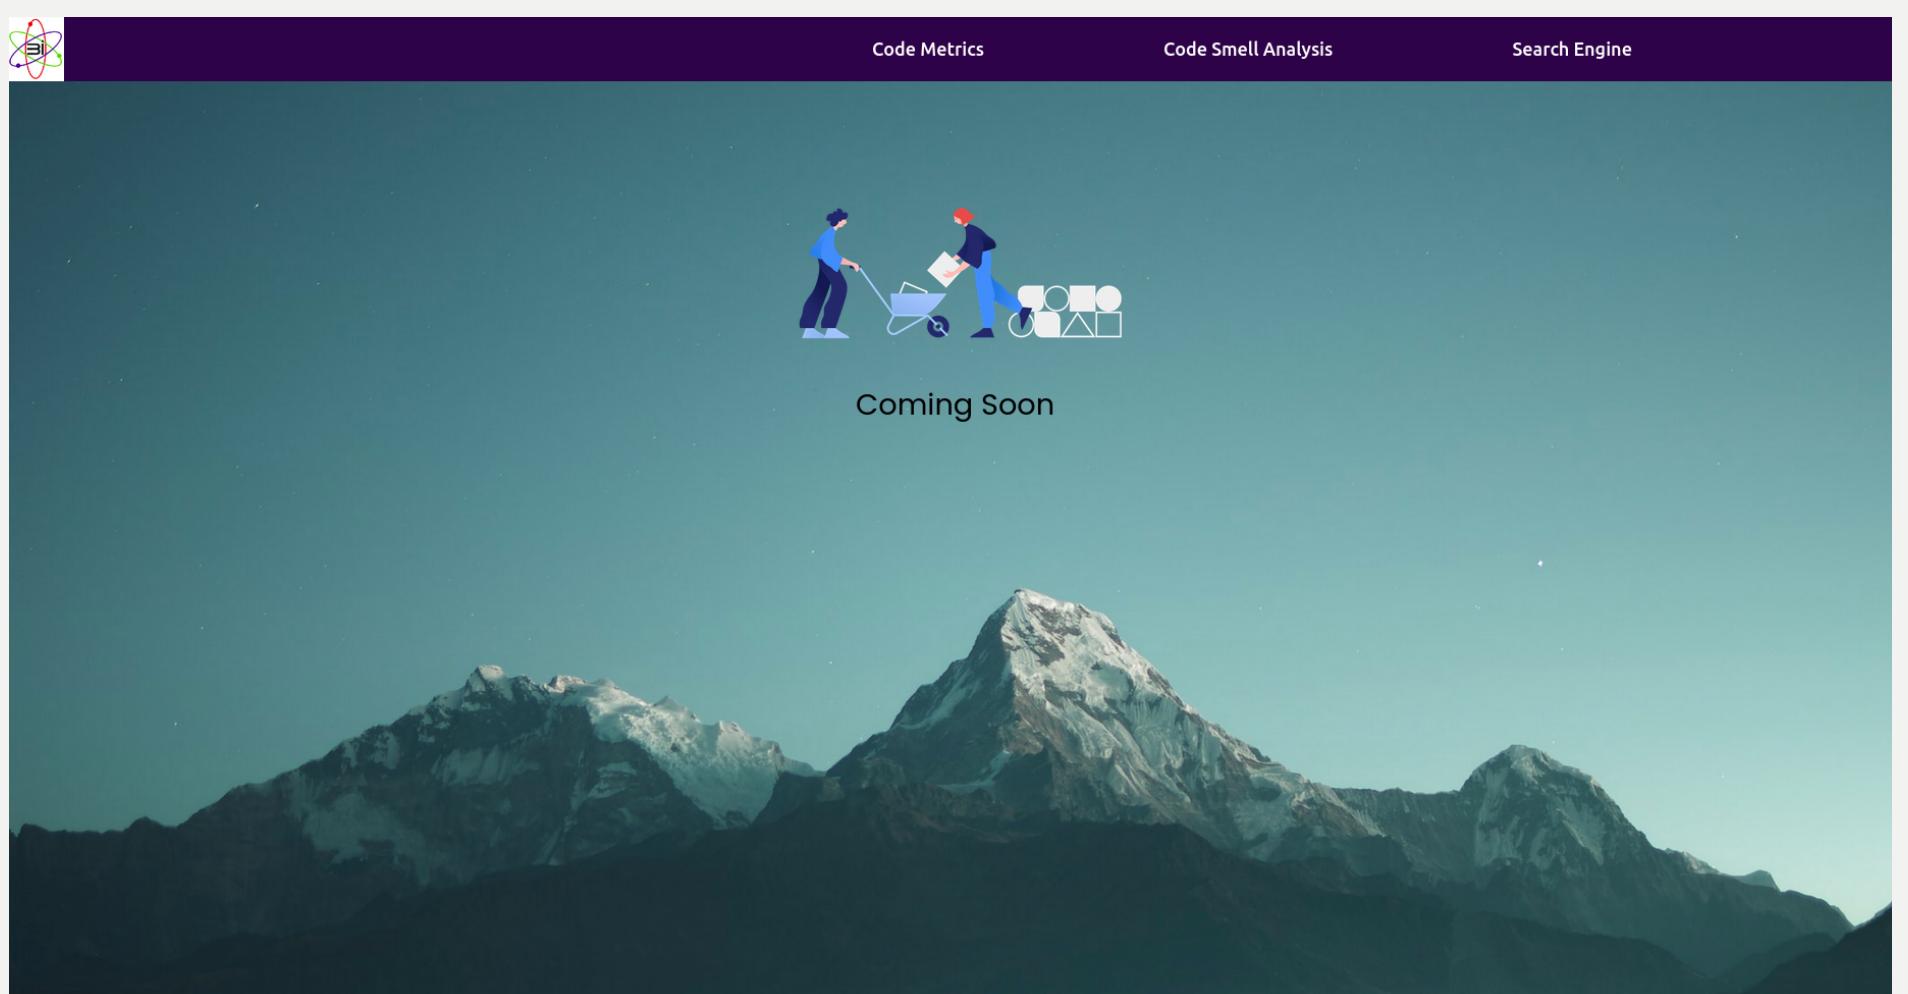

# Project Evidence and Best Practices

NSTRC

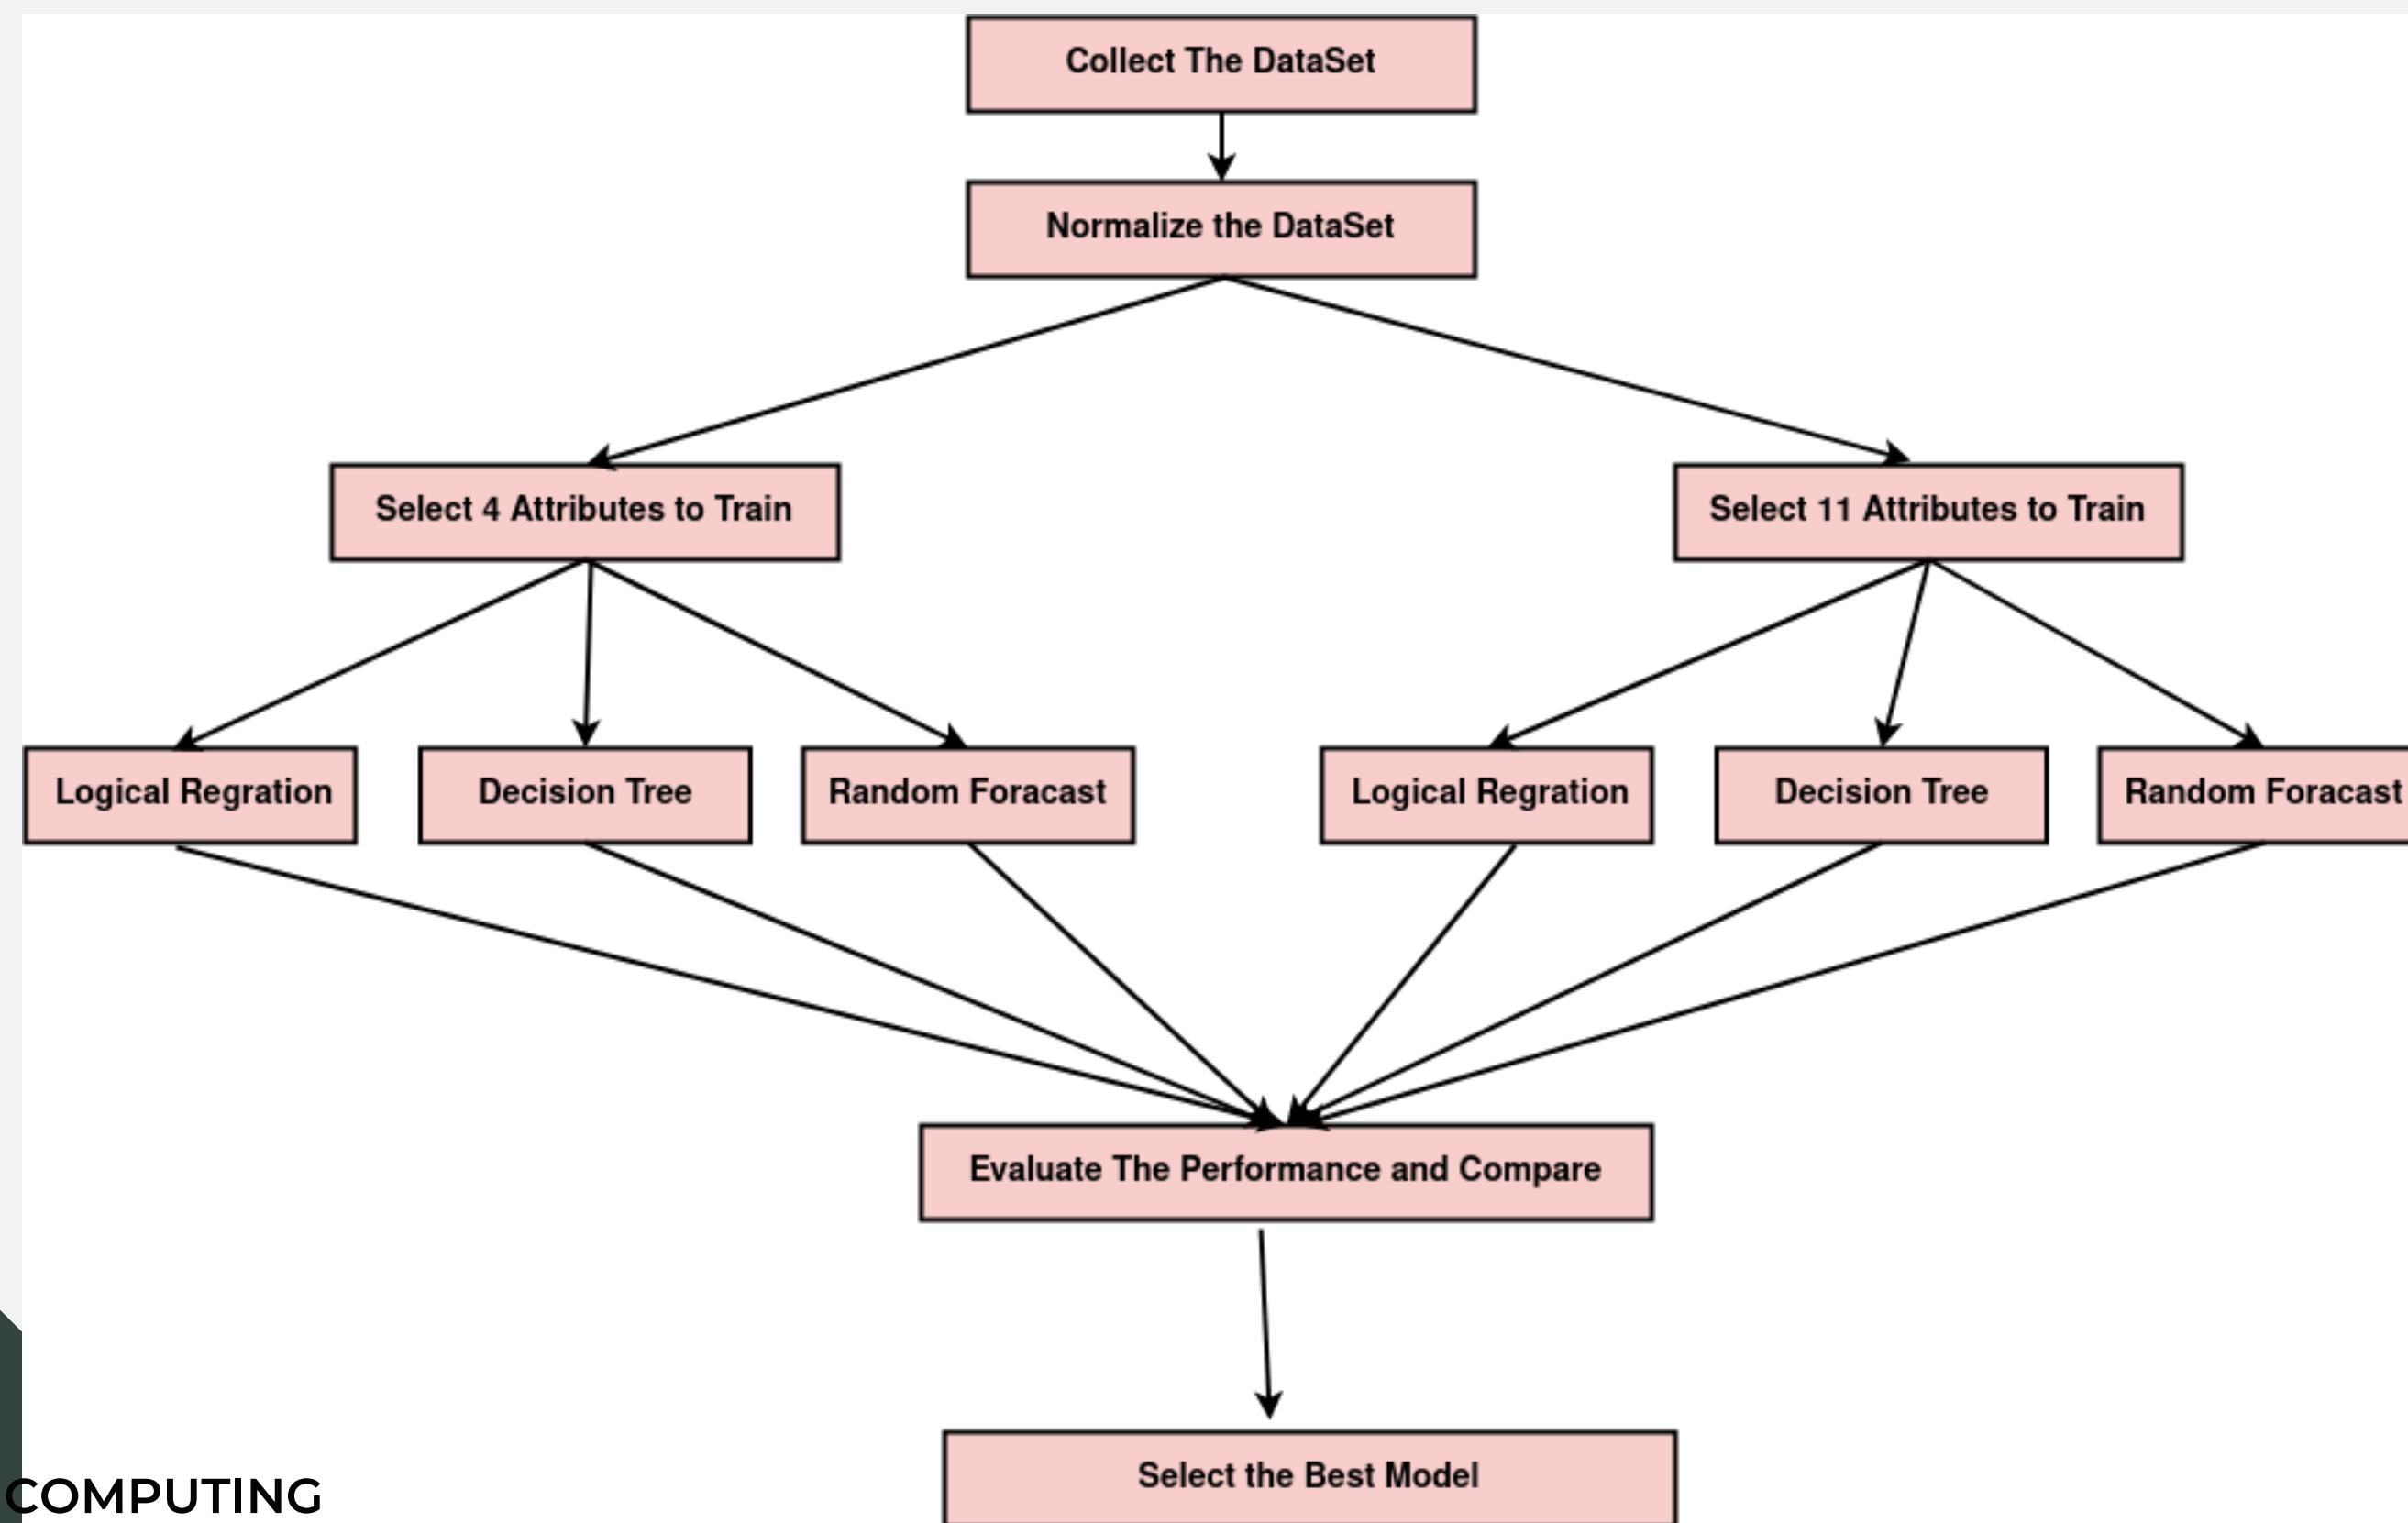

This screenshot shows a more detailed view of the 'Code Metrics' and 'File List' sections. At the top, there is a 'Folder Location' input field with the path '/home/prabath/Documents/RP Tutorials/PROJECT\_CODE/Analysing Projects/ExsampleProject/'. Below it is a 'Generate' button. The 'File List' section on the left lists five Java files: Main1.java, Main3.java, Main4.java, Main2.java, and Main5.java. To the right, the 'Code Metrics' section displays a JSON object with various code statistics. The background features a dark purple header with the NSTRC logo.

# Research Problem

- Developers always must ensure the efficiency of their software Programs
- Currently they do not have a proper way of providing a quality code to QA testers

# Research Objectives

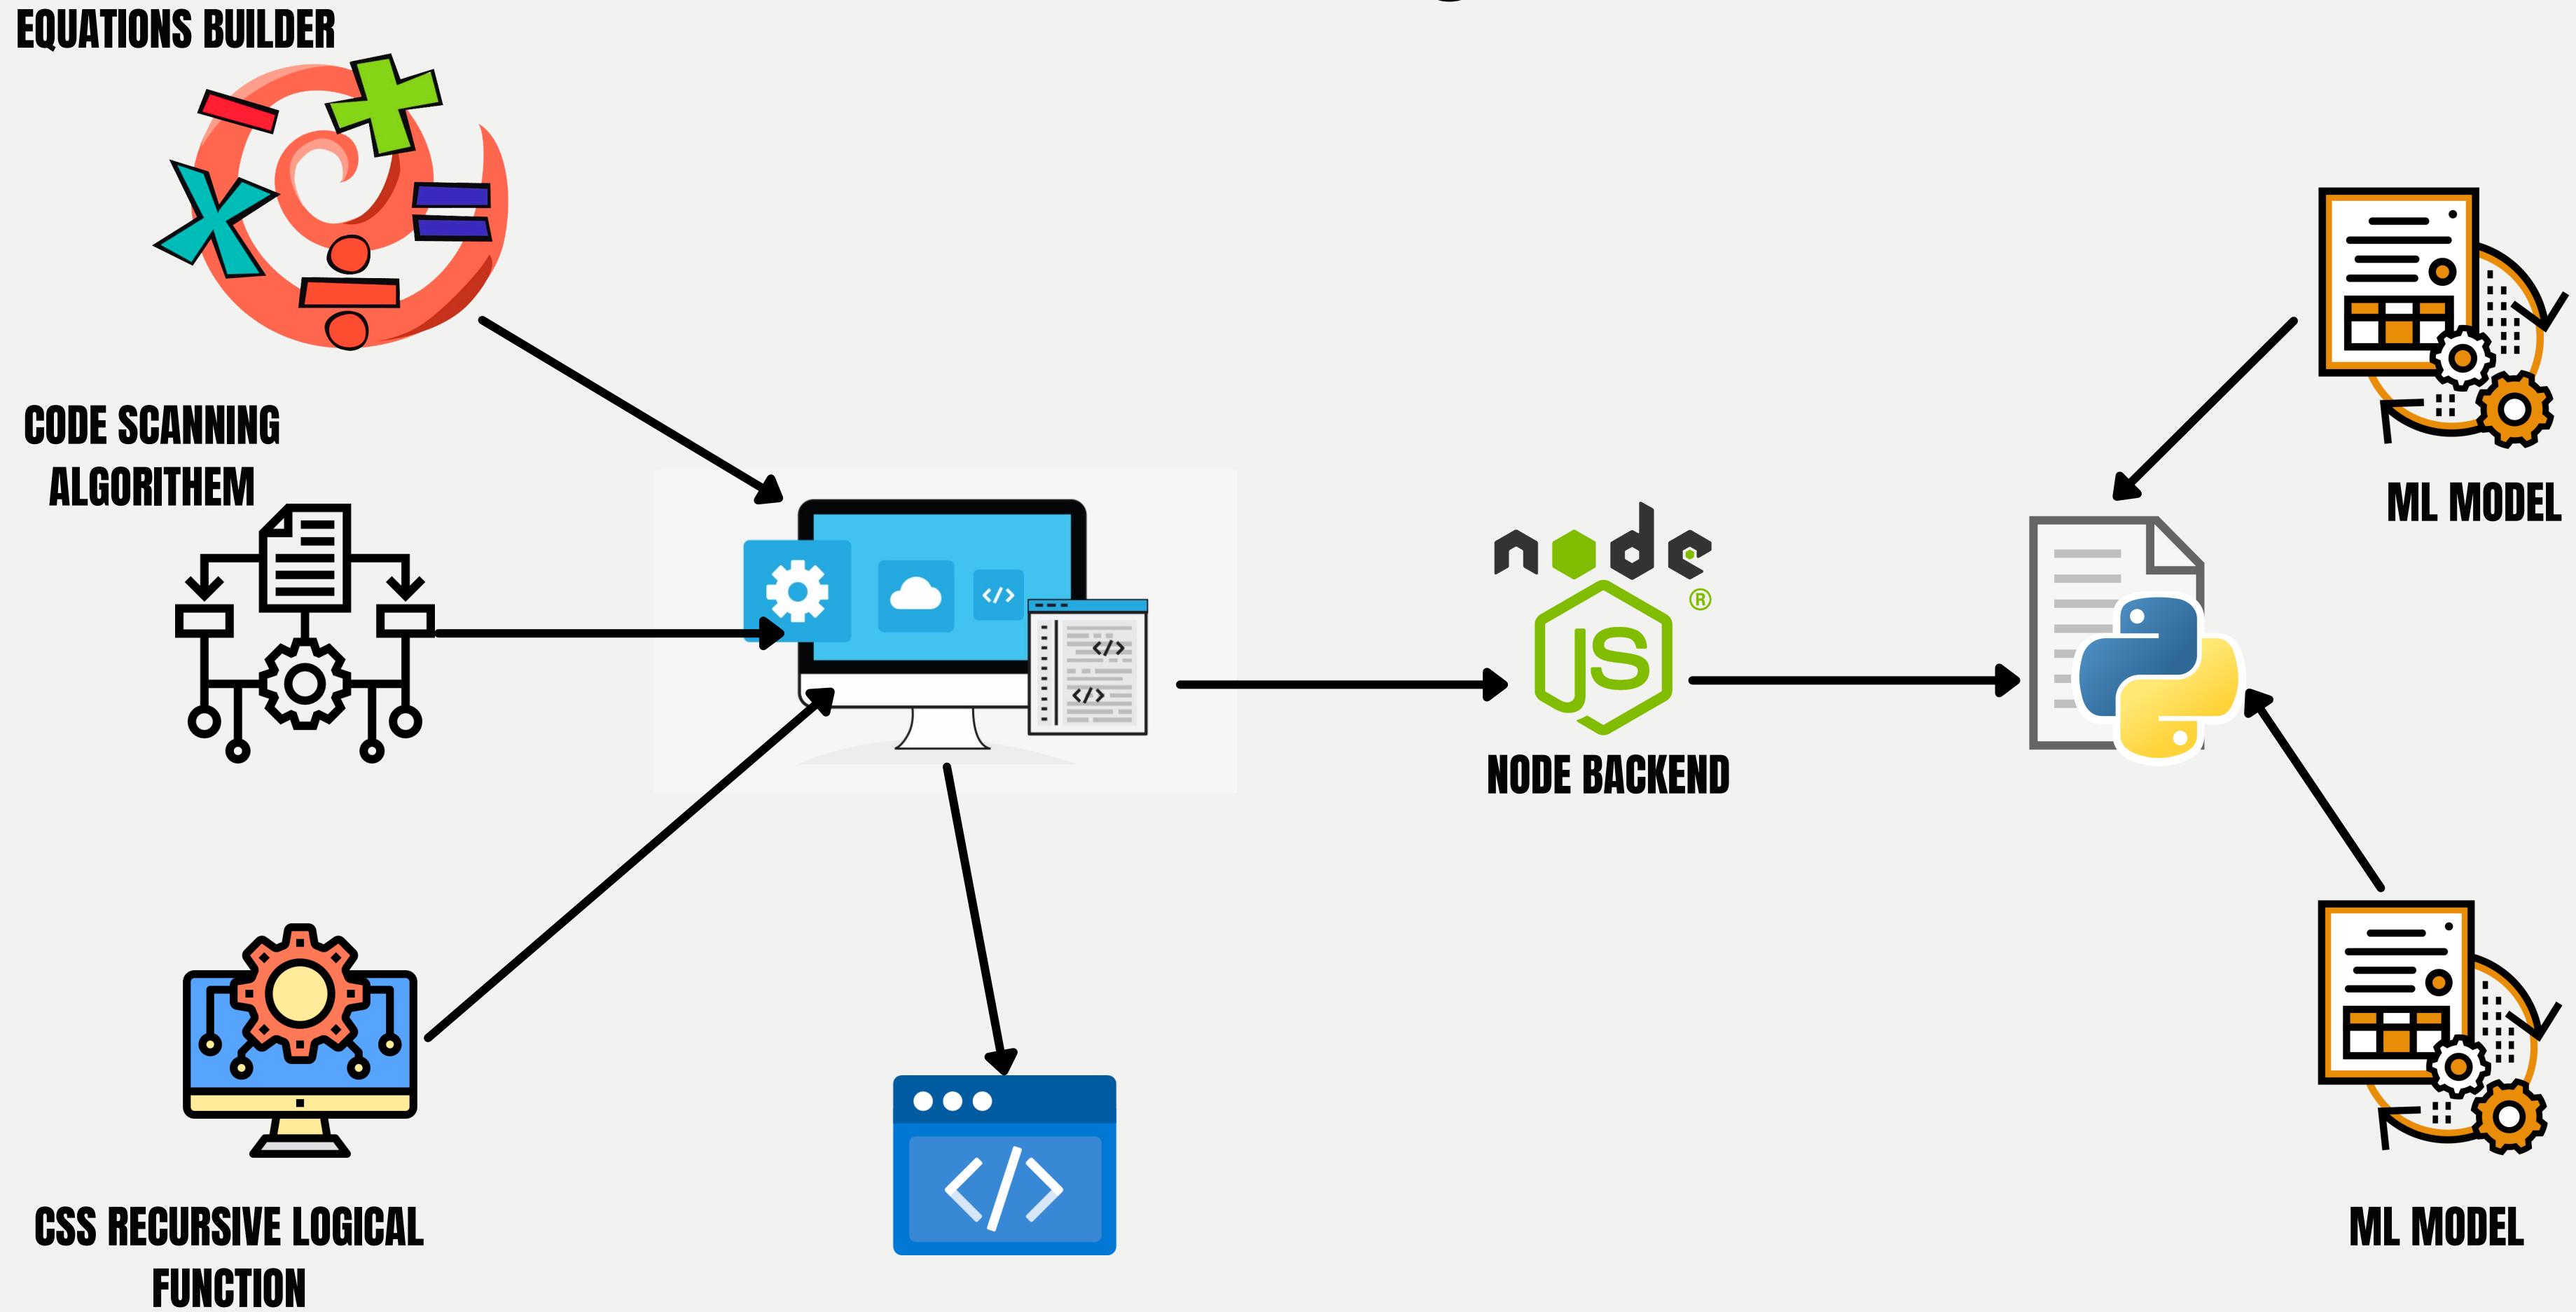

## Main Objective

- Development of Code scanner algorithem
- Create two Machine learning Model to predict defective value and Overall complexity
- Development of Equations Builder
- Development of Recursive CSS function to Draw abstract view

## Sub Objectives

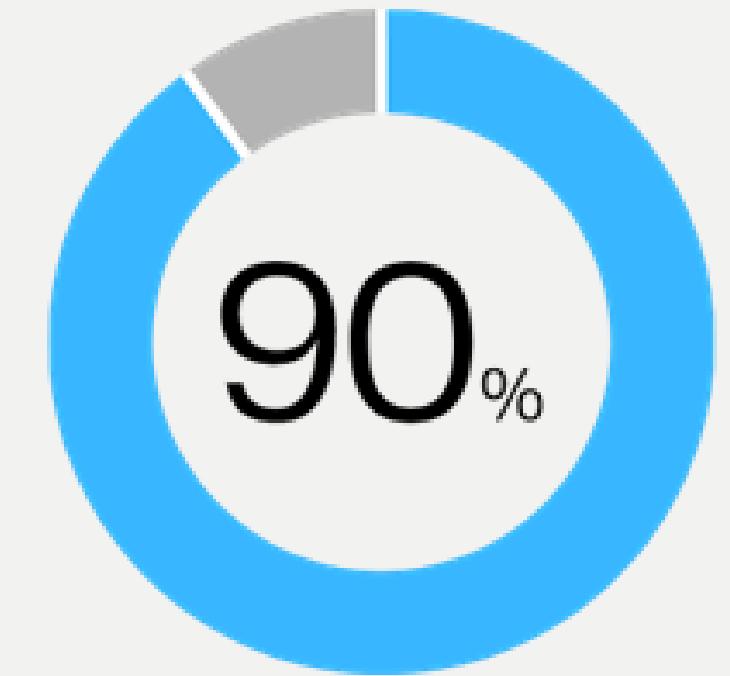

- Create the Front end that uses the code scanner, Equations builder, CSS function
- Create the backend that connect with the two ML models
- Identify Syntax Code Mistakes when Code scanner running

# System Diagram

# Current Progress

- Development of Code scanner algorithm
- Create two Machine learning Model to predict defective value and Overall complexity
- Development of Equations Builder
- Development of Recursive CSS function to draw abstract view

# Project Evidence and Best Practices

NSTRC

## it Javascript developer code Scanner

defects:0.021032548035212185

mcCabe's lines of code:  
13  
halstead's volume:  
62.26976913547135  
mcCabe's essential Complexity:  
  
McCabe's design complexity:  
  
halstead's total operands and operators:  
18

Put your code here..

```
let a = 2;  
if(x>1){  
let b = 8;  
}  
class Point {  
def constructor(x, y) {  
this.x = x;
```

## Code overall Complexity:

McCabe's cyclomatic complexity:

halstead's program difficulty:

halstead's effort:

140.10698055481055

halstead's program length:

28.75488750216347

halstead's intelligence:

27.67545294909838

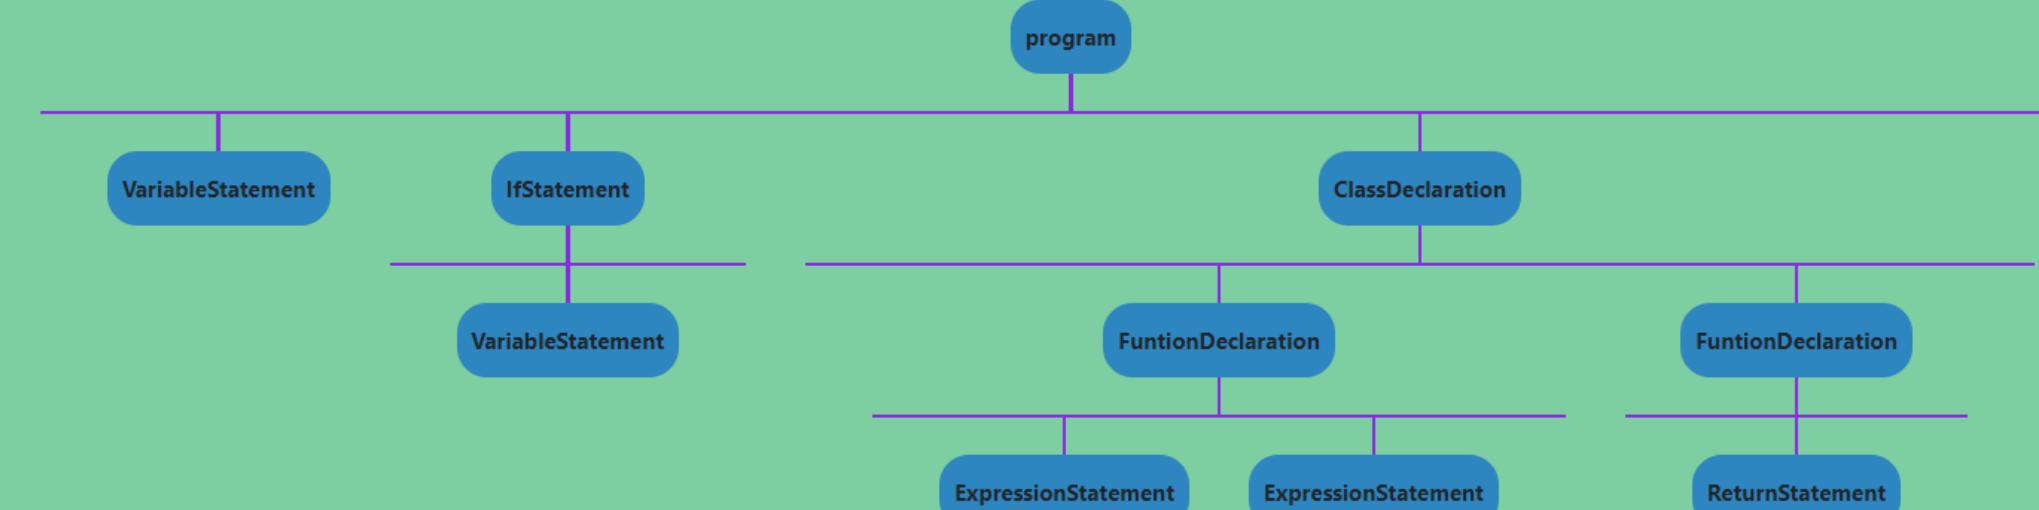

## Gigabit Javascript developer code Scanner

### Developer Json View

```
{  
  "type": "Program",

      "test": {  
        "type": "BinaryExpression",  
        "operator": ">"  
      }  
    }  
  ]  
}
```

## Javascript developer code Scanner

### dev DeveloperCodeView

# Requirements

NSTRC

## Functional requirements

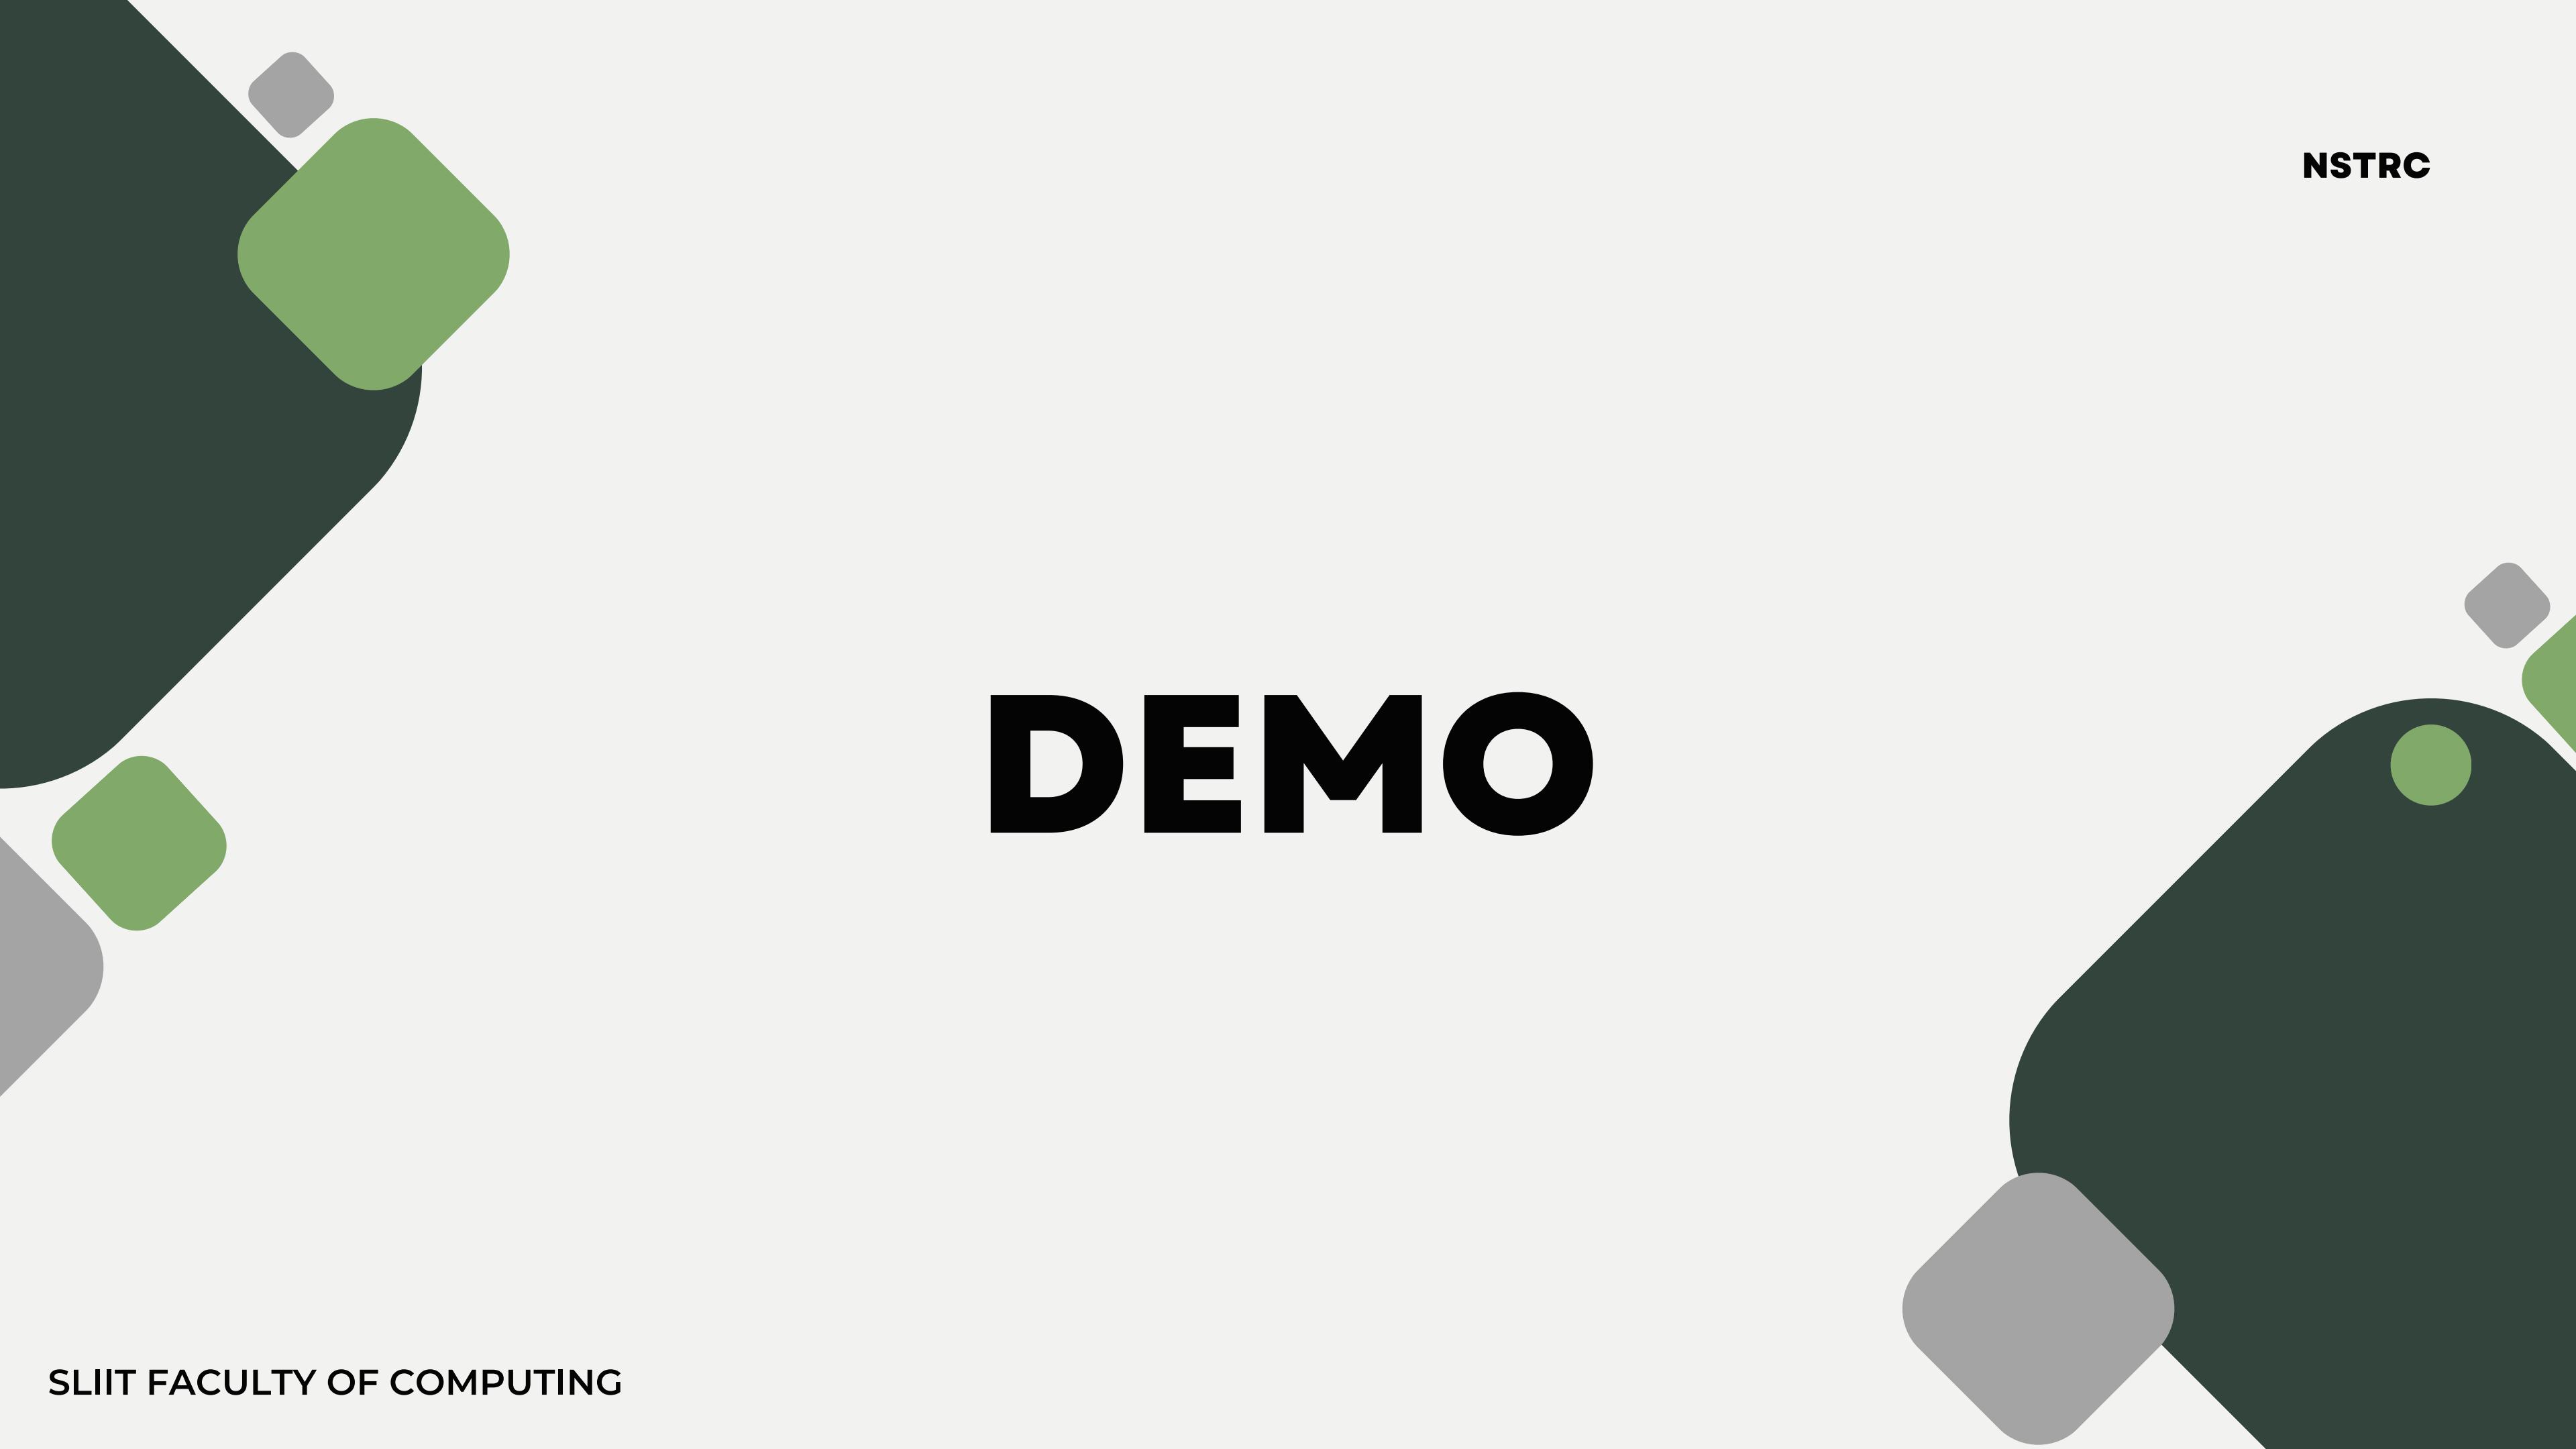

- Equations builder working accurately
- Machine learning Model will Predict the accurate outcomes
- Code scanner algorithem run effectively
- Recursive logical CSS function run smoothly

## User requirements

- Developer can input his JavaScript code and see abstract view
- Developer can see the defective Number and overall complexity
- Developer can see the Deep view of his JS code
- Developer can see his JS code status
